

CITY OF POCATELLO COLLECTION SYSTEM MASTER PLAN

Murray, Smith & Associates, Inc. (MSA) is currently completing a collection system master plan for the City of Pocatello. The project includes the development of a new GIS-integrated hydraulic model, calibration of the model, and deficiency analysis under existing and future conditions. Condition assessment information available in the City's maintenance management system will also be evaluated in conjunction with hydraulic deficiencies to develop a comprehensive

capital improvement plan for the next 20 years. Recommendations for inflow reduction in the historical city center will also be made from a comprehensive flow monitoring program. Lift station conditions will be evaluated and operations and maintenance procedures will be reviewed. Ultimately, MSA will train City staff in the use of the new model.
